

SD350 Coin Sorter and Counter

The SD350 Coin Sorter is specifically designed to sort and count mixed coins at speed, and can process up to 400 coins per minute.

When the mixed coins are put into the hopper of the machine, the steel disc spins clockwise to send the coins to the sensor. The sensor identifies the value of the coin, and then the disc continues to take the coin to its destination.

Features

The coins are sorted by size, so the wheel carries the coin until it reaches its designated case. The operating panel will give a running total as the coins are being sorted, and will also give individual totals when the sorting is completed. A maximum of eight different denominations can be sorted, and counted at the same time.

The SD350 Coin Sorter is also designed to assist in the bagging of coin. When the sorting and the counting is complete, a sequence of buttons will put the machine into batch mode. When in batch mode, the machine can count out a set amount of any one denomination, and put it back into its designated plastic case. For example, if the machine has sorted and counted 300 x 1c coins, by putting these coins back in to the hopper it can count out 100 x 1c coins, i.e. enough to fill a standard bank bag.
