SATURN

The Saturn is an innovative euro note multi detector. Using spectrum analysis, Saturn incorporates an infrared scanner, I.R.P.S, and holographic metal band detection, giving an exceptional level of authentication.

In obtaining multi levels of authentication the Saturn ensures reliability which exceeds that of its market predecessors. Its design allows for ease of use as a portable or fixed device with a test speed of approximately 0.5 seconds. The results are then clearly indicated by different coloured lights and a sound signal (which can be disconnected)

The Saturn is a detector that stands out from other due to the fact that it is extremely easy to use, and combines maximum-security levels in the face of falsifications and the rejection of authentic notes with minimum handling requirements.

Technical specifications:

- Spectrum analysis Infrared Scanner
 I.R.P.S (resolution 500 dlps)
 Holographic metal band.
- Acoustic and luminous signals for authentic and false notes
- Speed test in 0.5 seconds
- Mains operation or use of a 9v power pack which enables 5000 test.
- Minimum power consumption on standby between different checkups.
